
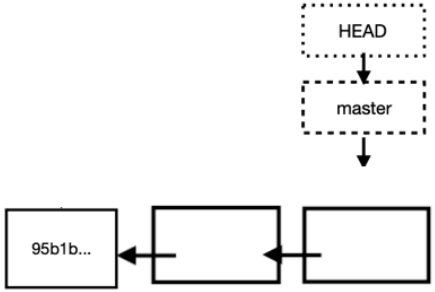
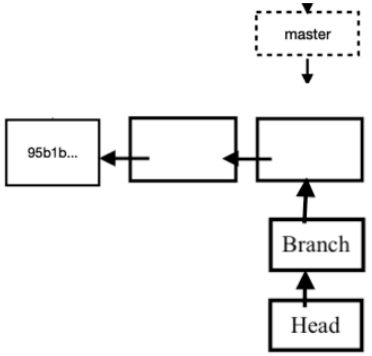
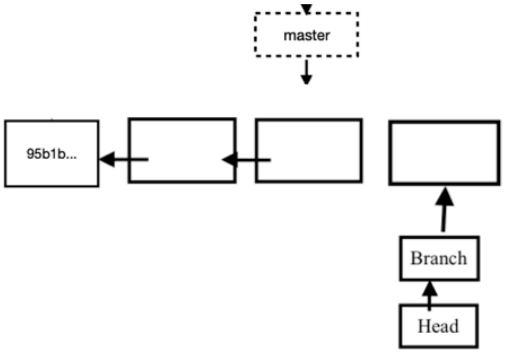
1) label each of the above boxes with what they are



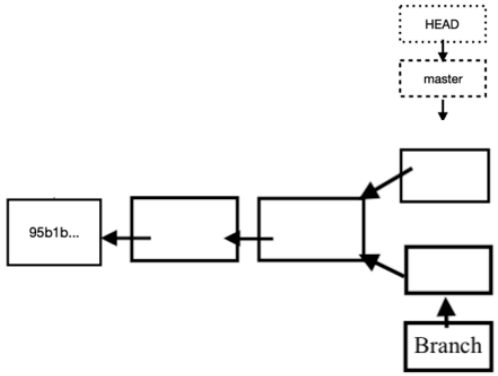
2) Draw the state of the diagram after 2 more commits have been made



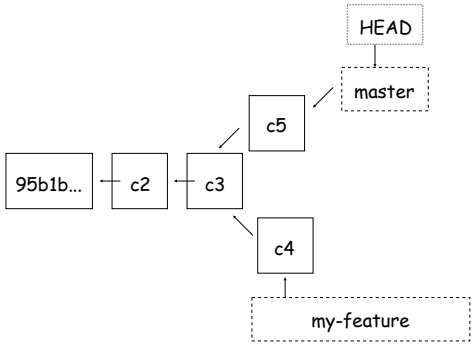
3) Draw the state of the diagram after a branch has been created



4) Draw the state of the diagram after a commit has been made on our new branch



5) Draw the state of the diagram after a commit has been made on master



Beginning state of your repository (locally)

"c2" is the second commit made to the repo and so on and so forth

Write down the commands you would run and the resulting state of your repo fo the following situations.

situation	git commands	resulting repo state
merge master into my-feature	git checkout my-feature git merge master	c6 is now on the my-feature branch. commit 6 points to c4 and c5. Head points to my-feature
make another commit on my-feature	git checkout my-feature touch filename.txt git add . git commit -m “message”	head points to my-feature. new file created and added to the branch.
push your local changes to my-feature to remote (assuming that an un-updated my-feature exists on remote)	git push origin my-feature	no changes on local repo
pull remote master into local master	git checkout master git pull	Head points to master. all the changes in master are now on the local repo
merge my-feature-branch into master	git merge my-feature	no more branches only master. commits on branch are now on master
